

PERSISTENT USAGE CONTEXT

5

ABSTRACT

10 A system and method for generating a persistent usage context is disclosed. In
an exemplary embodiment, a method of generating a persistent usage context includes
monitoring usage of an information handling system and generating a first representation
15 corresponding to a first item of usage and a second representation corresponding to at
least one of the first item of usage and a second item of usage. The first representation
and second representation are communicated so as to communicate an association of the
first representation to the second representation and to enable a determination of at least
one of the prior usage and current usage of an information handling system.
